

JAZZIR HUSSAIN HAMSA

📍 Bengaluru, India | ✉ jasirhussain2002@gmail.com |  [jazzirhussain](#) |  [jazzirhussain](#)

Backend-focused Full Stack Engineer | Node.js · React · AWS | 3+ YOE

Summary

Backend-focused full-stack engineer with 3+ years building SaaS platforms, real-time systems, and data pipelines — from API design through AWS deployment. Co-founded Nyon, a software studio where I led architecture and delivery of 8+ production systems now serving 600+ daily active users. Currently building enterprise-scale financial data pipelines at TCS (AML / financial crime domain).

Skills

Frontend: React.js (Hooks, Context, Performance Optimisation), Next.js (SSR, SSG, API Routes, Middleware), JavaScript/TypeScript, TailwindCSS, WebSocket

Backend: Node.js, Express.js, Python, REST APIs, JWT, RBAC, Rate Limiting, CORS

Databases: PostgreSQL, MongoDB, MySQL, Firebase Firestore

Cloud & DevOps: AWS (EC2, S3, Lambda, CloudFront, Route53), NGINX, Git, CI/CD, Linux

Other: MQTT, Redis, Firebase Functions

Experience

Tata Consultancy Services (TCS)

Software Developer — ETL & Data Pipelines

2024 – Present

Bengaluru, India

- Own backend engineering on the FCSO ECM platform — an enterprise financial crime case management system ingesting AML (Anti-Money Laundering) risk event data from multiple vendor sources; responsible for reliability and correctness of the full ingestion layer.
- Design and maintain **PL/SQL batch jobs** processing millions of financial records per run; correlate risk events by similarity scoring to auto-generate investigator cases in the ECM UI.
- Reduced batch processing errors by identifying and resolving data schema mismatches across 3 upstream vendor sources, improving pipeline reliability.
- Own the end-to-end design of batch job sequences — from ingestion schema decisions to error-handling strategy — within **Agile/Scrum** sprint cycles under strict financial-sector data governance and auditability requirements.

Nyon — Software Studio

Co-founder & Lead Backend Engineer

2022 – 2024

India (Remote)

- Founded a 5–6 person studio; owned all backend architecture, database schema design, and AWS infrastructure decisions across 8+ production products.
- Scaled School Management ERP to **500+ daily active users** across multiple branches — designed multi-tenant data isolation, RFID attendance ingestion, and a constraint-based scheduling engine.
- Built AI Valuation SaaS with async report generation pipeline (job queue + polling/webhook pattern) handling **~50–80 report generations/day** with Razorpay payment integration and **100+ DAU**.
- Managed all AWS infrastructure (EC2, Lambda, S3, CloudFront, Nginx) for concurrent production deployments; achieved consistent uptime across client systems.
- Reduced client billing time from **~20 minutes to under 2 minutes** by integrating Government e-Invoice and e-Waybill APIs into a single-form workflow.

Startup - Wizwack PVT LTD

Web Developer Intern

2021 – 2022

Remote

- **Led architecture migration** from Spring Boot monolith to AWS Lambda microservices, improving scalability and reducing server cost for the client's backend.
- Deployed React frontends on AWS EC2 with Nginx reverse proxy; built Firebase Functions microservices backend for a production mobile game.

IEEE & IEDC College Chapters

Chief Technology Officer

2022 – 2023

India

- Led technical strategy for two national engineering clubs; shipped college admission chatbot UI and festival websites serving 500+ concurrent event participants.
- Managed a team of junior developers; full ownership from requirements scoping to production deployment.

Projects

RFID-Integrated Academic Platform | [GitHub](#) | [Demo](#)

500+ DAU · Multi-branch

React, Node.js, PostgreSQL, RFID

- Designed **multi-tenant backend** with full branch-level data isolation; constraint-based slot booking engine handling ~300–500 bookings/day across rooms, instructors, and cohorts without conflicts.
- Integrated RFID reader hardware for real-time attendance — device events captured, validated, and persisted with sub-second latency via event-driven architecture.
- Implemented staff payroll engine, multi-round project submission/review workflows, and granular role-based access control across branch and admin levels.

AI Business Valuation SaaS | [GitHub](#) | [Demo](#)

100+ DAU · Live payments

React, Node.js, OpenAI API, Razorpay, PostgreSQL

- Architected **async report generation pipeline**: jobs queued on submission, processed via OpenAI (DCF, Berkus, VC methods), results delivered via polling + webhook — prevents API timeout on long AI calls.
- Handles ~50–80 valuation reports/day; avg generation time ~8–12 seconds end-to-end. Integrated Razorpay with subscription gating; live with paying customers.

IoT Analytics Dashboard | [GitHub](#) | [Demo](#)

Node.js, Mosquitto MQTT, AWS EC2, CloudFront, Time-series DB

- Built self-hosted **Mosquitto MQTT broker** on EC2 ingesting continuous telemetry at ~100ms update intervals; designed time-series pipeline from raw device payloads to real-time dashboard.
- Full AWS deployment (EC2+CloudFront CDN); infrastructure supports multi-device concurrency without message loss.

Education

Bachelor of Technology — Computer Science

2020 – 2024

Muthoot Institute Of Technology And Science, Ernakulam

- CGPA: 8.72
- CTO of IEEE and IEDC chapters — technical lead for national engineering events with 500+ participants.
